Change, fix, and convert strings in text files without using Microsoft Office, WORD, or other programs. This program has an inbuilt text editor and will allow you to update, find, and replace a specific text or pattern inside files. More...The present invention relates generally to the

field of data transfer over a network, and more particularly to a system and method for verifying that only authorized entities are able to access particular data over a network. Electronic commerce (e-commerce) is the buying and selling of goods and services over electronic networks such as the Internet. In addition to buying and selling goods or services, a substantial number of services are currently provided over the Internet. In e-commerce transactions, it is necessary to provide security mechanisms that

prevent unauthorized users from accessing sensitive data. Security mechanisms include restricting the users to access only the data that they are authorized to access, such as preventing a user from accessing data in another user's account. In order to access data in another user's account, a user must know the user's password and the URL that accesses the particular data. In many existing systems, the user must be authorized by the user who owns the account from which data is to be accessed. Unfortunately, the requirement

that the user who owns the data account must be the user who wishes to access the data can lead to a large number of access failures. Often, data owners have multiple users who access their data. Even if only one of these users owns the data account, all of the users are required to share the account and password in order to access the data. If any user has authorized another user to access his account, then all of the other users are also authorized to access that user's data. Thus, this requirement may require that a user who does not

own the account from which data is to be accessed share the account and password with the user who does own the account. An alternative method of allowing multiple users access to data in accounts that are shared by multiple users is for all users to share the same account and password. In this case, it is necessary to ensure that each user who accesses data in the account actually knows the password. Thus, if multiple users access the same account, it is necessary for each user to log into the account to check that the

password is correct. This method is cumbersome and provides an opportunity for unauthorized users to guess passwords. The requirement that the user who owns the data account be the user who wishes to access the data may also be used to

What is the point of arranging an  
interrogative 'why' question  
(when addressing oneself) in  
English? I am trying to get a  
native-English speaker's view on  
the following: If the above  
question were in English, what  
would be the point of forming it

in a particular way (relative to the questioner)? (and also the -ng, and -s forms) An example sentence: "why has [someone] did it?" Versus "Why has [someone] done it?" A: The construction you are questioning is called a wh-question, or question with wh-fronting. In English, wh-fronting often takes the form of WH-pronoun + fronting adverb, but it can be more general, for example in your case, WH + preposition + fronting adverb. 1) In English, WH-fronting is a grammatical category. Therefore, in order to

use the construction, a person is expected to have developed an explicit theory of that grammatical category. To put it in
